## Research interest

---

My main field of study is theoretical particle physics. I am profoundly interested in phenomenological studies. My research area includes theories with extra dimensions, physics beyond the Standard Model, top physics, rare processes, QCD, hadron physics, and the Standard Model effective field theory.

*Current research statement:* My current research focuses on projections of the Standard Model effective field theory (SMEFT) using experimental data. SMEFT is a convenient extension of the Standard Model (SM) of particle physics, in which one defines additional interactions of the currently observed spectrum of the SM, without introducing new ones, in terms of coupling constants, or SMEFT variables, of unknown magnitudes. We constrain these variables using experimental data from the Large Hadron Collider (LHC) at CERN and Hadron-Electron Ring Accelerator (HERA) at DESY. We also analyze data simulated using the predicted running parameters of the Electron-Ion Collider (EIC), under consideration for construction at present. One major significance of this research lies in obtaining experimental bounds on the variables in the SMEFT using such a legacy data as of HERA. It also plays an important role in determining the goodness of future colliders in constraining SMEFT variables.
